

AI Audit Report

Declaration

- AI used: Yes
- Scope: HW03 GUI usability testing materials in this repository
- Source basis: saved AI-assisted artifacts in `HW03-report.md`, the existing HW03 audit draft, the checklist and compatibility matrix, and the HW03 report

Tool Log

Date & Time	AI Tool	Prompt	Generated Output	Human Modifications	Validation	Limitations
2026-08-01 15:45:58 +07:00	ChatGPT (GPT-5.5)	Asked how to complete Task 3 (Cross-Browser / Cross-Platform Testing) and requested detailed steps.	Explained the workflow for choosing three screens, building a compatibility matrix, using BrowserStack or similar tools, testing OS/browser/device combinations, recording Pass/Fail results, capturing screenshots, and documenting evidence.	The workflow was narrowed to the actual EMS screens and file structure used in HW03.	Manually checked the final matrix and screenshots against the submitted report.	The AI provided planning guidance only and did not execute any tests.
2026-08-01 15:35:12 +07:00	ChatGPT (GPT-5.5)	Asked whether the compatibility matrix should be created before testing.	Recommended creating the matrix, report template, folder structure, and screenshot placeholders before running the real tests.	The advice was used to organize the documentation first.	Verified that the matrix and report were completed before final submission.	This was workflow advice, not a test result.
2026-08-01 15:27:34 +07:00	ChatGPT (GPT-5.5)	Requested a prompt to generate the compatibility matrix and folder structure.	Produced a prompt for <code>compatibility-matrix.md</code> , testing folders, and report placeholders covering Windows,	The prompt was adapted to the specific HW03 folder structure.	Compared the resulting matrix with the evidence folder and report.	The output was generic and needed project-specific adjustment.

Date & Time	AI Tool	Prompt	Generated Output	Human Modifications	Validation	Limitations
			macOS, Android, Chrome, Firefox, Edge, Safari, Opera/Samsung Internet, Desktop, Tablet, and Phone.			
2026-07-31 08:45:23 +07:00	ChatGPT (GPT-5.5)	Asked which online tools should be used for compatibility testing.	Recommended BrowserStack Live first, then LambdaTest, Sauce Labs, and real devices if needed.	BrowserStack was selected as the practical evidence source.	The report references BrowserStack-oriented evidence handling.	Tool availability and trial behavior can change over time.
2026-07-31 08:26:25 +07:00	ChatGPT (GPT-5.5)	Asked how many compatibility combinations are required.	Explained that the assignment does not require every possible OS/browser/device combination, only enough coverage so each category is represented at least once per screen.	The matrix was reduced to representative coverage instead of exhaustive coverage.	Checked that each category was represented in the final matrix.	The recommendation was interpretive, not an official grading rule.
2026-07-31 08:12:14 +07:00	ChatGPT (GPT-5.5)	Asked what should be tested on each screen.	Suggested checking layout, fonts, buttons, tables, forms, pagination, search, navigation, scrolling, responsiveness, modal dialogs, hover states, and click behavior.	The final checklist focused on the EMS screens and behaviors already documented in the report.	Reviewed the checklist against the tested EMS screens.	The list was broad and required trimming to match the assignment scope.
2026-07-31 07:57:49 +07:00	ChatGPT (GPT-5.5)	Asked how screenshots should be prepared.	Recommended taking screenshots first, overlaying the university email, renaming files consistently, then inserting them into the report.	The workflow was followed where screenshots were used.	Checked screenshot naming and placement in the submission package.	The advice did not account for every possible reporting format.

Date & Time	AI Tool	Prompt	Generated Output	Human Modifications	Validation	Limitations
2026-07-31 07:38:43 +07:00	ChatGPT (GPT-5.5)	Asked whether screenshots should be inserted after overlaying the email.	Confirmed the capture -> overlay -> rename -> insert workflow.	The sequence was accepted for the submission package.	Confirmed that the final evidence followed that order.	This was a confirmation step rather than new analysis.
2026-07-30 10:58:09 +07:00	ChatGPT (GPT-5.5)	Asked how to show operating system, browser, and device information when using real devices.	Explained that real-device screenshots may not show complete device details and suggested BrowserStack Live because it shows OS, browser, and device together.	The matrix labels were written to reflect the evidence available in the screenshots.	Checked that OS, browser, and device labels were recorded consistently.	Real-device screenshots can vary by account type and platform.
2026-07-30 10:42:15 +07:00	ChatGPT (GPT-5.5)	Asked how long BrowserStack Free/Trial lasts.	Said the trial availability can change and recommended completing testing within one session if possible.	Treated as planning guidance only.	No direct validation was possible from the repo alone.	Trial length is time-sensitive and may have changed since the interaction.
2026-07-30 10:31:28 +07:00	ChatGPT (GPT-5.5)	Asked why BrowserStack did not display device information.	Explained the difference between Desktop Live and Real Device sessions, and that Desktop sessions identify the device category as Desktop rather than a hardware model.	Desktop was recorded as the device type when using desktop sessions.	Checked consistency between the matrix and the screenshot labels.	The explanation depends on BrowserStack session type.

Date & Time	AI Tool	Prompt	Generated Output	Human Modifications	Validation	Limitations
2026-07-30 10:17:48 +07:00	ChatGPT (GPT-5.5)	Uploaded a BrowserStack screenshot asking where the device information was located.	Confirmed that BrowserStack Desktop Live does not show a desktop hardware model and advised recording Device = Desktop in the compatibility matrix while using BrowserStack for OS and browser information.	That interpretation was used in the report and matrix.	Verified the matrix terminology against the screenshot evidence.	The result depends on how BrowserStack renders each session type.
2026-07-30 09:57:41 +07:00	ChatGPT (GPT-5.5)	Requested an AI Audit Report using the provided template.	Generated a sample AI Audit Report covering Task 3 interactions.	The sample was replaced with content aligned to the actual HW03 files and interaction records in this repo.	Compared the final audit against the task files and existing HW03 report.	The original sample was generic and needed substantial editing.

Summary

- Main AI-assisted tasks:
 - Planning the GUI checklist and compatibility testing workflow
 - Choosing representative browser and device coverage
 - Interpreting BrowserStack desktop vs. real-device evidence
 - Organizing screenshot and report preparation
- Main corrections made by the human reviewer:
 - Narrowed generic AI guidance to the actual EMS scenario
 - Replaced sample audit content with HW03-specific records
 - Confirmed which outputs were planning guidance versus validated evidence
 - Added explicit limitations where the repository did not contain raw transcript history

Limitations

- The repository does not contain a complete raw prompt/response transcript for every AI exchange.
- Some dates, prompts, and outputs are reconstructed from the saved HW03 audit draft and related notes.
- AI did not execute any tests or independently validate the EMS application.
- BrowserStack behavior, trial availability, and UI details may vary over time.
